

Software & Services

AIS is an independent information technology firm. We provide affordable professional information technology software and services to customers in the insurance industry. Whether you need an "out of the box" RMIS, custom development or system consulting, AIS consultants can provide a quick and professional solution.

Why a Web-based RMIS ?

Based on our experience over the years most of the time and money spent on an information system is in behalf of installation and training. As personal computer software became more sophisticated it just made installations more difficult. After all was said and done the customer ended up with just a windows based clone of and old character based system.

Client server platforms compounded the problem with the high cost of installation, training, support and maintenance.

Fortunately with the expansion and popularity of the Internet and World Wide Web we can offer a truly remarkable system to the customer with us taking on the installation and maintenance chores. All this while making your decision support information available 24/7 accessible from anywhere around the world.

What our customers are saying...

"Your staff very quickly delivered a prototype application and then worked with us on modifications until the finished application was available. Sometimes, a client does not clearly describe the project specifications and this can result in subsequent client initiated modifications. We are most appreciative of the time your staff spent in helping us with these subsequent modifications. I believe the AIS prior experience in the brokerage and risk management fields together with its' information systems expertise gives AIS an edge in understanding the needs of the insurance community." - Walter Hannigan, Claims Manager- Consolidated Risk Services

"AIS consultants were instrumental in providing quality services migrating and upgrading a mission-critical application for our organization" - Davis Thayaril, IT Manager -The Home Insurance Company

Bluehawk™ Risk Management Information System

The *Bluehawk™* RMIS is a full featured entirely new Web-based Risk Management Information System. All development was done locally by AIS personnel that offer a wealth of experience in insurance claims systems and information technology. *Bluehawk™* is not an old system that runs on the Web but a new one built from the ground up to take advantage of the latest in Microsoft .NET and MS SQL Server technology.

The system is designed to be used by the non-technical user "out of the box" and only requires that you have access to an Internet browser.

We can get your data from various sources convert, consolidate, clean and store it on our secured hosting site database and you can also enter data manually using the various page modules if you wish.

All of this data and related reports can be accessed easily from anywhere that offers an Internet connection!

System Modules

Claims

The claims module will track all claim data including accident descriptions, payments, and reserves with unlimited integrated notes and diaries.

Policies

A policy digest is included in the system that captures policy dates, limits, deductibles and layers of participation.

Locations

You can capture detailed location information and attach the location to a claim for cost allocation purposes.

Exposures

Linked to the location module the exposures module will allow you to keep track of user defined exposure data including vehicles, buildings and other valued items.

Safety Inspections

Once you have your locations and exposures tracked you can use the Safety Inspections module to manage any recommendations and solutions to safety issues related to any location or exposure.

Litigation

If a claim goes to litigation this module will help you track plaintiff and defense attorney, docket and court information regarding the case.

OSHA 300

OSHA safety data can be entered then extracted from the system and printed to the approved government form.

Business Intelligence

Dashboard

The system dashboard automatically creates and displays reports that will highlight user defined performance measures.

Whether you need to see a top claims listing or which safety inspection actions are getting critical, you can view the system dashboard immediately after you logging in.

Standard Reports

The system standard reports can be run anytime and can be printed or exported in various common formats including PDF and Excel.
